Education and Academic Associations

Program	Institution	Year
Postdoctoral Researcher	Quantum and Laser Photonics Group, DTU Photonics, Denmark	07/2025–Present
Research Assistant	Applied Nano-optics Group, DTU Physics, Denmark	03/2025–06/2025
Visiting Researcher	Geballe Laboratory for Advanced Materials, Stanford University, USA	02/2024–06/2024
Doctorate in Physics	DTU Physics, Technical University of Denmark, Denmark	03/2022–02/2025
M.Sc. in Optics and Photonics	Karlsruher Institut für Technologie, Germany	2019–2021

Research Interests

Nanophotonics **Optoelectronics** **Excitonic systems** **VdW materials**

Research Experiences

Postdoctoral Researcher, Supervisor: Prof. Jesper Mørk

- Investigating excitonic light–matter interaction using topologically optimised InP resonators operating in the telecom wavelength range.
- Characterising ultrafast spectral and temporal dynamics of ultra-low threshold nanolasers through pump–probe measurement technique.

PhD Thesis: Light-matter interaction in excitonic layered materials
Supervisors: Prof. Søren Raza, Prof. Nicolas Leitherer-Stenger and Prof. Peter Bøggild

PhD – Primary Projects

1. **Encapsulated Void Resonators in van der Waals Heterostructures**
   - Fabricated nanoscale air-void arrays and assembled hBN-encapsulated heterostructure devices.
   - Performed bright-field reflectance measurements for optical characterization of the resonator structures.

   Key Findings:
   - Successfully confined and tuned optical resonances from the visible to blue-violet spectral range using nano-voids, overcoming classical limitations due to material loss at shorter wavelengths.
2. **Void Resonators for Highly Directional Light Emission from Monolayer WS_2**
   - Fabricated monolayer WS_2-on-void heterostructure devices based on nano-void arrays.
   - Performed bright-field reflectance and photoluminescence measurements to study emission behavior.

   Key Findings:
   - By exploiting dielectric void resonators, our monolayer-on-void device could achieve up to 3500-fold photoluminescence enhancement in monolayer WS_2.
3. **Impact of Strong Coupling on Optoelectronic Properties of Ultra-Thin Lossy Excitonic Systems**
   - Conducted detailed wavelength-resolved photocurrent measurements to determine the External Quantum Efficiency (EQE) of ultra-thin excitonic materials.
   - Investigated the influence of strong light–matter coupling on optoelectronic properties, correlating far-field optical signatures with photocurrent responses.

   Key Findings:
   - Demonstrated that Rabi-like splitting observed in reflectance does not necessarily imply true strong coupling or polariton formation in lossy systems.
   - Showed tunability of the coupled system by manipulating the phase of the optical resonance without changing the physical cavity length.

PhD – Other Projects

4. **Computational Discovery of High-Refractive-Index van der Waals Materials**
   - Developed a reactive ion etching (RIE) process to nanostructure HfS_2 into nano-disk arrays for optical resonator applications.
   - Contributed to dark-field scattering and bright-field reflectance measurements on nanostructured and thin-

film HfS_2 samples.

Key Findings:

- Identified HfS_2 as a promising low-loss, high-index optical material in the visible spectrum, and demonstrated its potential for efficient Mie-resonant nanophotonics.

5. **Fourier-Tailored Light–Matter Coupling in van der Waals Heterostructures**
   - Assisted in the fabrication of layered hBN/WS_2 devices integrated with Fourier surfaces.
   - Conducted reflectance spectroscopy to study the tailored light–matter interaction within the heterostructures.

   Key Findings:
   - Demonstrated that Fourier surface patterning enables engineering of the coupling between light and excitonic states in van der Waals heterostructures.

M.Sc.-Projects and Internships

6. **Study of self-decoupled isolated nNDI molecules as an electron-driven quantum light source**
   Master's thesis project (May 2021 – Oct 2021), Institute for Quantum Materials and Technologies, KIT.
   Supervisors: Prof. Dr. Wulf Wulfhekel and Prof. Dr. David Hunger
   - Helped to optimise the **Hanbury Brown and Twiss set-up** to increase photon collection efficiency.
   - Handled liquid Helium **cryostat**.
   - Performed **spectral analysis** of the collected light to appreciate different electron transitions.

   Key findings:
   - Observed electroluminescence and electronically driven quantum light source from a self-decoupled system.

7. **Printed thermoelectric devices**
   Research assistant (40 hours/month, Nov 2020 – Oct 2021) and Intern (Nov 2021-Feb 2022), Light Technology Institute, KIT
   Supervisors: Prof. Dr. Uli Lemmer and Dr. Mofasser Mallick
   - Helped to **synthesize and characterize** (Seebeck coefficient by a homemade set-up and electrical conductivity by hall measurement) novel thermoelectric ink.
   - Fabricated screen printed **flexible thermoelectric devices**.
   - Helped **optimizing the photonic sintering process** to improve the performance and flexibility of the printed devices.

   Key findings:
   - Developed an ultra flexible thermoelectric ink for flexible electronic applications.
   - Wrote a review article on printed thermoelectric devices.

8. **Assembling of a cryostat system and temperature-dependent optical measurements of Perovskite semiconductors**
   Intern (Aug 2020 – Oct,2020), Light Technology Institute, KIT
   Supervisor: Prof. Dr. Uli Lemmer
   - **Assembled a cryostat system** for a time-correlated single photon counting setup.
   - Performed **temperature-dependent steady-state and time-resolved photoluminescence** (TRPL) of perovskite films in a cryogenic environment.

9. **X-ray diffraction on nanoparticles**
   Research assistant (40 hours/month, Feb 2020 – Apr 2021), Institut für Funktionelle Grenzflächen, KIT
   Supervisor: Prof. Dr. Kristen Kozielski
   - Deviced and performed **X-Ray Diffraction on Cobalt Iron Oxide NPs** in the presence of varying magnetic fields to find out the effect of the magnetic field on the length change of the NPs.
   - **Characterized magnetostrictive materials** by the vibrating-sample magnetometer.

Teaching and Supervision

- **Teaching assistant** in Solid State Physics course (10 ECTS, 130 hours).
- **Supervised** two students for bachelor's thesis, helping them optically characterise Hafnium disulfide nano-disks as a novel optical material.

Industry Experience

- **Developer** at Tata Consultancy Services, India from Oct 2016-Sep 2019.

Schools, Seminars And Conferences

- **SCOM5:** 5th International School and Conference on Optoelectronics, Materials, and Nanotechnology, 16–19 Jun 2025, Odense, Denmark (poster presentation).
- **Stanford University Photonics Retreat (SUPR):** The annual event hosted by the Stanford Optical Society, 26–28 April 2024, Stanford University, USA (poster presentation, best poster award).
- **Metamaterials:** The 17th International Congress on Artificial Materials for Novel Wave Phenomena, 11–16 Sep 2023, Crete, Greece (poster presentation).
- **NANOSUM:** International summer school on nanoscience and nanotechnology, 13–25 Jun 2022, France (poster presentation).
- **Seminar:** Label sensing of nano-systems by whispering gallery microresonators under Prof. Dr. David Hunger, KIT, Germany.

Expertise

- **Fabrication:** Electron-beam lithography, reactive ion etching, different positive and negative electron resists, exfoliation, stacking to device heterostructures.
- **Characterisation:** Pump-prob measurement technique for measuring ultrafast spectral and temporal dynamics, Bright- and dark-field spectroscopy, photocurrent measurement, HBT interferometry and photoluminescence measurement for optical characterisation; Hall measurement and STM for electronic characterisation; AFM, SEM and profilometry for topological characterisation; cryostat and lasers for different purposes.
- **Simulation and data processing:** COMSOL, MATLAB, C++, Origin.

Achievements And Initiations

- **Grants**: Otto Mønsteds Fond (2024), William Demant Foundation (2024), Merit -Cum-Means Scholarship by West Bengal state government (2012-2016).
- Best poster award at Stanford University Photonics Retreat (2024).
- Ranked 3558 among around 120 thousand students in the Engineering entrance examination (WBJEE-2012).
- Member of DTU Physics PhD committee since Jan 2023.
- Participated in International Astronomical Search Collaboration Campaigns in collaboration with NASA. Our team discovered a near-earth asteroid.
- Member of Breakthrough Science Society since 2012.
- Founding member of Curiosity Circle – Mumbai, works to promote scientific temperament in society.
- Conducted science outreach events, regular science learning sessions through experiments with underprivileged school students, and wrote popular science articles.
- Member of Oskar-Optics Students Karlsruhe (SPIE and OSA student chapters of Karlsruhe Institute of Technology).
